Ms. Tarryn Brennon
Chief Privacy Officer
Georgia Institute of Technology

Dear Ms. Brennon,
Our team conducted a review of Georgia Tech's *Data Governance & Management Policy*, *Security Camera Use Policy*, and *Privacy & Legal Notice* to evaluate how the Institute governs personal data, particularly in relation to surveillance technologies. Our analysis focused on identifying privacy risks and gaps in how visual and surveillance data are managed across policies, as well as how clearly these practices are communicated to students, faculty, and visitors.

We identified several key privacy risks:

- Surveillance data such as video footage and images are not explicitly addressed in the *Data Governance & Management Policy*, creating ambiguity in how this data should be classified, managed, and protected across different departments.
- There are no clearly defined retention limits for surveillance footage, which increases the risk of excessive or indefinite data storage and raises concerns about long-term exposure of personal information.
- There is a lack of consistent transparency, as surveillance systems are widely used across campus but are not always accompanied by clear signage or public notice, making it difficult for individuals to understand when and how they are being monitored. Additionally, there is limited clarity regarding oversight and accountability mechanisms for surveillance systems, which may make it harder to ensure consistent policy enforcement over time.

To address these issues, we recommend several practical improvements:

- Georgia Tech should explicitly include video and photographic data within the scope of its *Data Governance & Management Policy* to ensure consistent classification, handling, and oversight across all units. This would reduce ambiguity and align surveillance data with existing governance structures.
- The Institute should establish standardized retention limits for surveillance footage, with clearly defined timelines for deletion unless the data is required for active investigations or legal purposes. This would help minimize unnecessary data storage and reduce privacy risks.
- Georgia Tech should improve transparency by implementing campus-wide signage in monitored areas and publishing clear, accessible information about surveillance technologies, including their purposes and data handling practices.
- The Institute could strengthen oversight by introducing periodic reviews or audits of surveillance systems to ensure that their use remains appropriate, consistent, and aligned with institutional policies.

Addressing these gaps would strengthen Georgia Tech's privacy governance framework, improve transparency for students and staff, and ensure that surveillance technologies are used in a responsible, consistent, and accountable manner across the Institute.

Sincerely, *Team 7 – Tom Kim, Shreya Mahesh, Naya Patel, and Aesha Shah*
